I am a double major in Mathematics and Computer Science at UC Santa Barbara with a strong interest in computational science. I have built a strong foundation through coursework in numerical analysis, real analysis, algorithms, and Lagrangian mechanics, complemented by graduate-level work in measure theory and PDE methods.

Currently, I work as an undergraduate researcher in the Computational Applied Science Lab at UCSB, where I am developing a CUDA-based solver for Hamilton-Jacobi equations, with applications in control theory and computational neuroscience. This experience has deepened my interest in numerical methods and parallel computing, and I am eager to apply these skills to challenging problems in scientific computing.

My previous internships have given me experience with performance-critical systems and rigorous software development practices. At Playlab AI, I developed benchmarking frameworks for document parsing systems, and at HiveTop, I worked on embedded device telemetry systems using Rust. These roles strengthened my ability to write efficient, maintainable code for technical applications.

I am particularly drawn to the National Laboratory of the Rockies, and feel that my experience would be relevant for data visualization. I would welcome the opportunity to contribute to ongoing research while developing my skills in computational science. I plan to pursue a master's degree in applied mathematics in Germany and am focused on building a career at the intersection of mathematics, computing, and scientific research.

I can provide references upon request.

Best regards,
Nate Annau
