I am a double major in Mathematics and Computer Science at UC Santa Barbara with an interest in computer security. I have built a strong foundation through undergraduate coursework in computer architecture and computer security, complemented by work in autonomous bug identification techniques through my graduate computer security course. In addition, I have completed around 10 CTFs in the past year, as a member of my CTF team, newline (currently 60 in the USA).

At my previous internship at Playlab AI, I found several minor security vulnerabilities (mainly possible DoS attack vectors), and performed an audit of my area of the codebase. While my main job was software development, I kept a watchful eye out for security vulnerabilities. During the summer, I flew to Las Vegas for DEF CON 33, and participated in several security challenges there. Most notably, I ended up getting 2nd place out of 300+ competitors in a geographic OSINT challenge.

I am particularly drawn to Los Alamos National Lab, and feel that my experience would be relevant for positions in cyber-security and critical infrastructure. I would welcome the opportunity to contribute to ongoing research while developing my skills in computer security. I plan to pursue a master's degree in applied mathematics in Germany and am focused on building a career at the intersection of mathematics, computing, and scientific research.

I can provide references upon request.

Best regards,
